TITLE: Glued joints in shipbuilding

SOURCE: Sudostroyeniye, no. 8, 1966, 54-58

TOPIC TAGS: marine engineering, glue, glue welding, metal gluing, fiberglass, reinforced plastic

ABSTRACT: The authors study various types of glued joints, select the best types of glue for their respective uses and test glued joint specimens for strength. The results of this study showed that the use of metal, plastic-composition and combination glued joints is feasible in shipbuilding. Static load and vibration testing showed that glued steel and fiberglass-reinforced plastic joints are as strong as welded joints and further that glued joints made of light alloy and fiberglass-reinforced plastics are stronger than welded joints. It was also shown that a glued joint incorporating two fiberglass-reinforced plastic members may be stronger than a single unit made up of pure fiberglass-reinforced plastic. It is suggested that a series of designs be put forth which can be realized completely by gluing in order to make the introduction of glued, glued-welded and glued-riveted joints easier. Among other recommendations is standardization of boatbuilding and mechanizing gluing. Orig. art. has 3 tables.

SOV/153-58-5-22/20

TITLE: The Dissolution and Reprecipitation of Copper Phthalocyanine
(Perecsazhdeniye ftalotsianina medi)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya
tekhnologiya, 1958, Nr 5, pp 131-135 (USSR)

ABSTRACT: Only after the dissolution and reprecipitation of the β -
modification of copper phthalocyanine (dissolution in sulfuric
acid, separation with water) it is transformed to the α -
modification with valuable coloric properties, and which, in
contrast to the β -modification is widely used as blue dye. The
conditions for this process determine to a high degree the
quality of the dye. None of the data in publications at hand
mentions the dependence of the coloristic properties of the dye
upon its production conditions. The Soviet "goluboy ftalo-
tsianinovyy" (phthalocyanine light blue or sky-blue, respectively)
has for a long time been insufficient especially as regards
its shade. The present work is part of a comprehensive investi-
gation and deals with the dissolution and reprecipitation. Com-
mercial copper phthalocyanine synthesized according to the urea
process was used for this investigation (42-48% admixtures),

Card 1/5

SOV/153-59-5-22/2C

The Dissolution and Reprecipitation of Copper Phthalocyanine

furthermore that copper phthalocyanine which had been purified by boiling with HCl. The investigation is divided into four sections dealing with the effect of the following factors upon the shade of the dye: 1) The state of the copper phthalocyanine in the acid; 2) The temperature prevailing during the process; 3) Castor oil, and 4) Dispersgators. Based on the results obtained the authors arrived at the following conclusions: The use of castor oil in this process renders this process difficult and does not secure good coloristic properties of the dye. Among several substances used as dispersgators in this process "Emul'far FM" (triethanol amine soap) proved to be the best. The optimum conditions for this process are: Dissolution of the commercial copper phthalocyanine in 96% sulfuric acid at a ratio of 1 : 10 at a temperature of not above 25°. Then the precipitation by injection of the solution through a jet into a 30% sulfuric acid containing triethanol amine soap is carried out. The sulfuric acid and the water used for this process must not contain any mechanical impurities.
There are 7 references, 6 of which are Soviet.

TITLE: Plasticizing hardeners of epoxy resins

SOURCE: Nauchnaya konferentsiya molodykh uchenykh Moldavii, 3d. Trudy, no. 1: Vystavlenno-tehnicheskiye nauki (Natural and technical sciences). Kishinev, Gosizdat Kartya Moldovenyasko, 1964, 64

TOPIC TAGS: plasticizing hardener, epoxy resin, epoxy resin hardener, plasticizer, versamide, polyamide

ABSTRACT: Amides synthesized on the basis of vegetable oils (so-called "versamides") have lately been used as hardeners of epoxy resins because they are non-toxic, they harden resins to various degrees of elasticity, increase their life expectancy, and permit departures from stoichiometric relationships without worsening the covering efficiency. This paper reports on the synthesis of low-molecular polyamides by epoxidation of the methyl ethers of unsaturated aliphatic acids contained in vegetable oils, and by the subsequent introduction of an amino group via the reaction of polyamines with the epoxy group. The paper notes, without giving any details, that the author analyzed the products, investigated the compos-

ition of the epoxy groups, and studied the molecular weight, number of double bonds, and the coefficient of refraction of the intermediate and final products. She also studied the usefulness of the newly-formed amides as hardeners of epoxy resins, tested resin layers for bending and strength, and compared the results with those from samples using polyethylenepolyamine and industrial versamide. These tests showed that the new product has satisfactory plasticizing properties. Orig. art. has: 1 formula

TITLE: Plasticizing curing agents for lacquer based on epoxy resins

SOURCE: Lakokrasochnyye materialy i ikh primeneniye, no. 4, 1965, 33-35

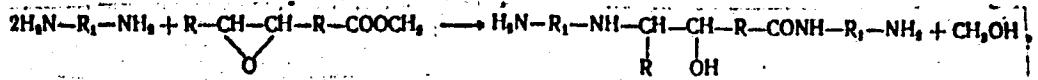

TOPIC TAGS: epoxide, polyamine compound, plasticizer, sunflower oil, methyl oleate, methyl epoxyoleate, epoxy resin, curing agent, polyaminoamide, polyethylenepolyamine, diethylenetriamine, triethylenetetramine

ABSTRACT: The purpose of the work was to synthesize low-molecular polyaminoamides suitable for curing low-molecular epoxy resins. The polyaminoamides were prepared from epoxy group-containing methyl esters of either unsaturated acids of sunflower oil or oleic acid. The sunflower oil products were obtained by transesterification of sunflower oil, according to Tyutynnikov's method, followed by the introduction of the epoxy group by treatment with 50—60% hydrogen peroxide. The method is described in brief in the original. The yield of epoxy products was 30—70%. Condensation of the epoxy products with polyamines, taken in excess, was supposed to take place according to the following reaction:

Card 1/2

L 1860-66

ACCESSION NR: AP5022511

A total of four variations of the curing agents were obtained: 1) sunflower oil product + diethylenetriamine; 2) sunflower oil product + triethylenetetramine; 3) methyl epoxyoleate + diethylenetriamine; 4) methyl epoxyoleate + triethylenetetramine. Curing of epoxy resins ED-5 or ED-6 was completed with the above new curing agents and, for comparison, with diethylenetriamine or triethylenetetramine. The results indicated that the resins cured with the new agents produced better coatings; the curing agents worked simultaneously as plasticizers, increasing the elasticity and improving the external appearance of the coatings. The chemical stability of the resins obtained was equal to that of resins cured with polyethylenepolyamines. The new curing agents are not toxic or irritant to the human skin.

TITLE: Synthesis of methacrylic acid based on isobutylene. Reaction mechanism of isobutylene with N_2O_4 .		
SOURCE: Neftekhimiya, v. 5, no. 6, 1965, 873-879		
TOPIC TAGS: chemical reaction, IR absorption, isobutylene, nitration, nitric oxide, IR spectrum, spectrophotometer, acrylic acid, organic nitroso compound, nitrate		
ABSTRACT: The mechanism of reaction of isobutylene with liquid N_2O_4 was studied by examining the IR spectra of the reaction products. The ob- ject of this work was to examine the feasibility of synthesizing metha- crylic acid by reacting isobutylene with liquid N_2O_4 . The IR absorption spectra were taken with IKS-14 spectrophotometer with a NaCl prism. The polarographic analyses of the reaction products were made with a VNR po- larograph made by Orion Company. The reaction was conducted at 0°C and at 20°C in dichloroethane solvent. The nitrosonitrate of isobutylene

TITLE: Intraspinal tumors in children

SOURCE: Ceskoslovenska neurologie, v. 28, no. 6, 1965, 403-407

TOPIC TAGS: tumor, neurologic surgery, diagnostic medicine, nervous system disease
ABSTRACT: Authors' English summary modified: Cases of 16 children, 6 months to 14 years old, that were treated at the Krajsky hospital at Bratislava in 1951-1963 are described. The progressive character of the disease appears to be characteristic. Examination methods that seem valuable are: pressure measurement of the cerebro-spinal fluid and examination of the fluid, and the X-ray examination of skeletal changes as a function of intraspinal hypertension that appears at a relatively early stage. Determination of these changes can be used to locate the lesion and find its relation to the spinal cord. Perimyelography using Myodyl as contrast material is recommended. Because of the type of the tumor and the relatively long time needed for diagnosis, surgical treatment of spinal cord tumors is less successful in children than in adults. JPRS 7
